together in CorelDRAW Graphics Suite X5. Clinical and molecular-cytogenetic evidence for co-occurrence of X/Y-autosome translocations of the longest chromosome pairs with alobar holoprosencephaly and laterality defects in a large Turkish family. We present the clinical findings in a large consanguineous family in Turkey in which two children, a girl and a boy, displayed midline facial anomalies in combination with laterality defects. In addition, the girl had corpus callosum

---

agenesis and psychomotor retardation. Her male sibling showed a relatively normal phenotype. Fluorescent in situ hybridization (FISH) studies revealed three X/Y translocation products, an XX,Y,+1.16,+1.22 karyotype in the female proband, an XX,Y,+1.15,+1.18,+1.21 karyotype in the boy, and an XX,Y,+1.12,+1.14,+1.18,+1.19,+1.21 karyotype in the father. Both translocation products were at chromosome 1. Subsequent FISH analyses revealed partial trisomy

---

of chromosome 1 in the girl and a normal karyotype in the father. A common location of the X/Y translocations was assigned to chromosome 1p32-p34 (1p32-p34). In the male, chromosome 1p32-p32 was translocated to the long arm of one of the homologous sex chromosomes. No reciprocal translocation was detected in the mother. Despite the maternal origin of the X/Y translocation, the proband's mother had both a normal female karyotype and a

---

normal phenotype, despite having two affected children in her family. Molecular cytogenetic studies of two different translocation breakpoints showed that a 7.4-Mb segment of the longest human chromosome, i.e., chromosome 1p, was fused to the short arm of chromosome 1 and that the translocation breakpoint occurred at the 1p22-1pter boundary. The sister
